Good to know

An MR Arthrogram is a diagnostic MRI technique used to assess the condition of a joint after it has been injected with a solution containing gadolinium (sometimes referred to as a contrast agent or "dye"). It is most commonly used to look inside the hip, shoulder, knee, wrist, elbow or ankle. A contrast solution is injected into the joint area to highlight several joint structures.

An MR Arthrogram can be used to:

- *Detect abnormalities - An MR Arthrogram may be used to determine a possible abnormality that may have been detected with an MRI scan.*
- *Assess joint conditions - An MR Arthrogram scan is used to diagnose and treat joint injuries related to the knee, shoulder, wrist, elbow, hip or ankle. It provides a clear image of the soft joint issues.*
- *Highlight joint structures - Contrast material inserted into the joint can highlight smaller joint structures more extensively.*
- *Evaluate injuries - It can help to determine whether a certain injury expands outside of a single joint.*

How do I book an MR Arthrogram with Vista Health?

Speak directly to one of our dedicated patient care team directly on **03300 572317** Monday to Friday 8am-8pm, weekends 8am-1pm.
